A CODE TO REPRESENT "ADD"

#include <iostream> → header file used for input/output operations.

using namespace std;

class ArrayList { → class of arraylist.

private : → private elements / hidden.

int * myElements; → a pointer to array which gonna hold value.

int myCapacity; → how many value array can hold.

int mySize; → how many values are currently stored.

public:

ArrayList() { → constructor of arraylist runs when object is created.

myCapacity = 10; → i'm setting total slots 10.

mySize = 0; → i'm saying it is fresh / zero.

myElements = new int [myCapacity]; } → ask computer for space to hold 10 integers.

void add(int value) { → method of Add.

myElements[mySize] = value; → assign value to array.

mySize++; } → increment by 1.

int size() {

return mySize; }

int get(int index) {

return myElements[index]; }

int main() { → main runs first.

ArrayList list; → object of class, constructor runs.

list.add(10); → by object, call function, pass a value.

list.add(20);

list.add(30);

cout << "Size : " << list.size() << endl; → size ⇒ 3.

cout << list.get(0) << endl; 10

cout << list.get(1) << endl; 20

cout << list.get(2) << endl; 30

return 0;

}
